

QA users and Production users, 2 types of dashboards

Production:

- > Creates product(name, description, document, model/image, code)
- > Pushes product to
 - > QA team, they get a notification
 - > Rest of the production team

QA:

- > Recieves the product
- > Checks for quality
- > Rejects the version and sends it back to production
- > Approves the version and puts it on the approved list

Each push by the production is stored as a verion on both the production and QA dashboards, and can be separately viewed to compare and contrast

final version is updated in the "approved products" bracket

products under the process are updated in "processing products" bracket

The processing products bracket can be clicked to see past versions pushed by prod team
